

Kut-Rite

No matter how you *kut* it.

Fastrak Grinding Systems™

Triple Trak 20

The Fastrak family of polisher/grinders are gear driven, true planetary machines, which maintain the same precise planetary pattern in either the forward or reverse modes of operation.

Kut-Rite's geared design is more durable than belt driven units, with no belts to change and delivers more torque to the work surface than belt driven units.

The Triple Trak 20 features the stability and balance that Kut-Rite surface preparation machines are renowned for, with aggressive flattening capabilities in the metal bond stages without compromising delicate accuracy in the final polishing steps - All with the efficiency that makes this Kut-Rite tool excellent at high production. The easily adjusted single tension-clip seal fits tightly against the grinding surface and is virtually dust free when connected to vacuum systems such as the KleanRite™ KRV25 or KRV5SL.

The Fastrak variable speed VFD is simple to use and the weight of the machine does not compromise ease of control on any concrete, granite, marble or stone surfaces. This is the premier multi-surface tool for removal of coatings glues and applied products, as well as for grinding and polishing.

The Triple Trak 20 unit features Kut-Rite's unique tool mounting design, which gives the option of using either magnetic quick disconnect tooling or standard mount tooling.

Fastrak Grinding Systems™

Triple Trak 20

Quick Disconnect (QD) Magnetic Tooling

Kut-Rite's new Quick Disconnect tool mounting design is redefining how diamond tools are mounted. The QD system incorporates two locating pins, for precise tool positioning and the use of powerful neodymium rare earth "super magnets" to hold the tools in place. The result of this combination produces a tool system that allows quick and precise placing of tools for smooth running, holding power that virtually eliminates tool kick out during operation and extremely fast removal/insertion time.
